Wagenborg Nedlift - The art of heavy transport

Introduction

The demand for cleaner energy is ever increasing. The electricity production and distribution industry is engaged in continuous improvement of its processes and technology. Whether wind turbines, biomass, waste incineration plants, gas-fired or coal-fired power stations are used, the businesses in the sector are renovating or expanding. The expertise of Wagenborg Nedlift could be particularly opportune in these processes. Wagenborg Nedlift is your all-round partner in the fields of project logistics, transport, lifting, assembly, engineering and project management.

Boiler Revamping

Removal and replacement of components in and around industrial combustion boilers frequently calls for specialised lifting techniques. Our skilled, experienced employees welcome the challenge of helping you with reconditioning jobs associated with combustion boilers. Working with heavy components, at heights and in the cramped space of a boiler or boiler room – all within the time constraint of a short production stop – calls for great creativity combined with a high level of safety. Many clients value our approach and the quality of our work. We are therefore proud of our extensive experience, acquired over decades, in this field

Factory to Foundation Logistics

Construction projects around power stations and waste incineration plants are a logistical challenge. Turbines, transformers, generators and boilers have to be brought in from suppliers all over the world. True specialists that can combine multimodal logistics, lifting and assembly are hard to find. Wagenborg Nedlift is just such a specialist. As part of the Royal Wagenborg Group, Wagenborg Nedlift is also able to offer you the extensive expertise of its sister companies, whose specialities include sea shipping, storage, transshipment, tugboat services and project freight forwarding. In this way we can perform your complete transport under literally one flag. For you, as the customer, this means that you can let us take care of the complete logistics of your project, including the accompanying risks. You will have just one contact person for your complete logistics and that gives you the room to concentrate on your own speciality.

Under the motto of 'from factory to foundation', we transported among others a 410 tons heavy transformer from Bad Honnef to KW Walsum, four transformers of more than 300 tons from Austria to the substation in Diele in North Germany, a complete power island from various production sites in Europe to a new power plant in Gent and a turbine installation from the Dominican Republic to Ireland.

Wind energy

Since the creation of the first wind farm at Eemshaven a few decades ago, Wagenborg Nedlift has been closely involved in maintenance work on wind turbines. In addition, we have a variety of new wind farm construction projects to our credit in the Netherlands and in other countries. Our scope included all the transport, lifting and assembly work, including engineering and project management.

Projects realised recently include windpark Westereems in Eemshaven where Wagenborg Nedlift took care of the complete just-in-time logistics to the construction sites. We also used our caterpillar cranes to perform lifting work during the construction of windparks in, among others, Zurich and Koblenz.

Safety and Quality

Our clients expect high standards from their contractors, especially when it comes to safety and quality. Our employees have long made safe working part of their normal routine. Safety and quality are top priorities in our operational policy and defined aspects of our management system. In practice, this translates into great attention to the safe performance of our work. Standard operational procedures and the training and education of our employees are key instruments in this. For that reason, Wagenborg Nedlift easily meets the required basic standards in this field. We are certified in line with the ISO 9001, VCA** and WT accreditation regulation.

Clients

Our satisfied clients in the energy and waste processing sector include businesses of various categories, such as:

- Electricity production and distribution companies
- Waste incineration companies
- Engineering and consultancy companies
- Manufacturers of boilers, turbines, generators, transformers and other equipment
- Boilermakers and boiler revamping specialists
- Installation companies
